6. CLINICAL TRIAL PROTOCOL AND PROTOCOL AMENDMENT(S)

6.1. General Information

6.1.1.

Protocol title, protocol identifying number, and date. Any amendment(s) should also bear the amendment number(s) and date(s).

6.1.2.

Name and address of the sponsor and monitor (if other than the sponsor).

6.1.3.

Name and title of the person(s) authorized to sign the protocol and the protocol amendment(s) for the sponsor.

6.1.4.

Name, title, address, and telephone number(s) of the sponsor's medical expert (or dentist when appropriate) for the trial.

6.1.5.

Name and title of the investigator(s) who is (are) responsible for conducting the trial, and the address and telephone number(s) of the trial site(s).

6.1.6.

Name, title, address, and telephone number(s) of the qualified physician (or dentist, if applicable), who is responsible for all trial-site related medical (or dental) decisions (if other than investigator).

6.1.7.

Name(s) and address(es) of the clinical laboratory(ies) and other medical and/or technical department(s) and/or institutions involved in the trial.

6. CLINICAL TRIAL PROTOCOL AND PROTOCOL AMENDMENT(S)

6.7. Assessment of Efficacy

6.7.1.

Specification of the efficacy parameters.

6.7.2.

Methods and timing for assessing, recording, and analysing of efficacy parameters.

6.8. Assessment of Safety

6.8.1.

Specification of safety parameters.

6.8.2.

The methods and timing for assessing, recording, and analysing safety parameters.

6.8.3.

Procedures for eliciting reports of and for recording and reporting adverse event and intercurrent illnesses.

6.8.4.

The type and duration of the follow-up of subjects after adverse events.

6. CLINICAL TRIAL PROTOCOL AND PROTOCOL AMENDMENT(S)

MODIFICACIÓN DE UN PROTOCOLO:

Enmienda (Addendum): descripción escrita de una modificación o aclaración formal de un protocolo.

- RELEVANTE
- NO RELEVANTE

Es un documento que se ha de notificar a el/los investigador/es, a el/los CEIC/s, (a las Comunidades Autónomas) y a la agencia reguladora.

¿ Cómo se lleva a cabo una enmienda ?

PROTOCOLO DE ENSAYO CLÍNICO

ENSAYO CLÍNICO DE FASE II, PRUEBA DE CONCEPTO, CON ASIGNACIÓN ALEATORIA, ABIERTO Y MULTICÉNTRICO, PARA EVALUAR LA EFICACIA Y SEGURIDAD DE ICATIBANT EN PACIENTES INFECTADOS POR SARS-COV-2 (COVID-19) E INGRESADOS EN UNIDADES DE HOSPITALIZACIÓN, SIN VENTILACIÓN MECÁNICA INVASIVA, COMPARADO CON EL ESTANDAR DE CUIDADO (ICAT-COVID)

Producto experimental: Icatibant (Firazyr®)

Promotor:
Instituto de Investigación Biomédica de Bellvitge (IDIBELL)
Avinguda de la Granvia de l'Hospitalet, 199
08908-L'Hospitalet de Llobregat, Barcelona

Código de Protocolo: HUB-MdI-ICAT-COVID-201
Código EudraCT: 2020-002166-13
Fase de desarrollo: II

Investigador Coordinador:
Dr. Pierre Malchair
Servicio de Urgencias
Hospital Universitario de Bellvitge
Carrer de la Feixa Llarga, s/n,
08907-L'Hospitalet de Llobregat, Barcelona
Tel.: +34. 93 2607575

Monitor Médico:
Dr. Jordi GIOL Amich / Dr. Xavier SOLANICH Moreno
Servicio de Urgencias
Servicio de Medicina Interna
Hospital Universitario de Bellvitge
Carrer de la Feixa Llarga, s/n,
08907-L'Hospitalet de Llobregat, Barcelona
Tel.: +34. 93 2607575

Versión protocolo	Fecha
Versión 2.0	15/05/2020 - versión evaluada por CEIm.
Versión 3.0	05/06/2020 - incluye las aclaraciones del CEIm y la AEMPS.
Versión 3.1	11/12/2020 – se incluye el cambio de promotor, investigador coordinador y monitor médico, se actualiza el equipo del promotor, se actualiza el protocolo de acuerdo con las evidencias actuales (diciembre 2020) y se incluye un nuevo centro.
Versión 3.2	21/01/2021 – se corrigen las discrepancias detectadas entre el resumen y el cuerpo del protocolo. Incluye la aportación económica que realizará el laboratorio TAKEDA.

Versión 3.2 del 21 de enero de 2021

Cambios realizados en el protocolo de la versión 3.2 respecto a la versión previa (versión 3.1)	
Página	**Se introduce la siguiente modificación:**
9, 30	se unifica el primer criterio de exclusión en el resumen y cuerpo del protocolo, quedando: "Muerte inminente (expectativa de vida ≤ a 24h)."
20	Mención al aporte económico que será realizado por el laboratorio TAKEDA para cada centro, destinado a la subsanación de costes propios del estudio.

Cambios realizados en el protocolo de la versión 3.1 respecto a la versión previa (versión 3.0)	
Página	**Se introduce la siguiente modificación:**
1, 21, 63	se introduce el cambio de promotor, de investigador coordinador y de monitor médico.
7, 29-30	El protocolo se actualiza de acuerdo con las evidencias actuales (diciembre 2020): se incluye dexametasona y remdesivir en la medicación del SoC.
7, 9, 31, 39, 44	El protocolo se actualiza de acuerdo con las evidencias actuales (diciembre 2020): Se incluye la prueba de antígeno como prueba diagnóstica de la infección por SARS-CoV-2. Por tanto, la infección por SARS-CoV-2 se confirmará por PCR o antígeno
9, 31	El protocolo se actualiza de acuerdo con las evidencias actuales (diciembre 2020): Se modifica de 4 a 10 días desde la confirmación de la infección por SARS-CoV-2 para ser incluido en el ensayo clínico: "Criterio de inclusión: Infección por SARS-CoV-2 confirmada por PCR o antígeno ≤10 días antes de la aleatorización"
9, 31	El protocolo se actualiza de acuerdo con las evidencias actuales (diciembre 2020): se incluye como criterio de exclusión: "Haber sido vacunado contra el SARS-CoV-2 / contra el COVID"
30, 61	Se incluye un nuevo centro participante.
61	Se incluye el nuevo investigador principal del Hospital Universitario de Bellvitge. Se actualiza el equipo del promotor.

Cambios realizados en el protocolo de la versión 3.0 respecto a la versión previa (versión 2.0)	
Página	**Se introduce la siguiente modificación:**
1, 4, 5, 63, 67	en el título, se ha añadido la palabra "invasiva" para especificar el tipo de ventilación mecánica que queda excluida del estudio.
6, 27	se añade el apartado 7.2 Objetivos secundarios: Objetivo exploratorio: Evaluar el impacto de icatibant en la carga viral del SARS-CoV-2.
7, 39	se ha identificado la escala de estado clínico de la OMS como la escala de 8 puntos.
8, 40, 41, 44	se añaden las 3 visitas que se realizarán durante el periodo de hospitalización: visita 2, visita 3 y

EUROPEAN MEDICINES AGENCY
SCIENCE MEDICINES HEALTH

15 December 2016
EMA/CHMP/970057/2011
Committee for Medicinal Products for Human Use (CHMP)

Guideline on the clinical development of medicinal products intended for the treatment of pain

Draft Agreed by Biostatistics Working Party	December 2012
Draft Agreed by Paediatric Committee	March 2013
Draft Agreed by Central Nervous System Working Party	May 2013
Adoption by CHMP for release for consultation	30 May 2013
Start of public consultation	1 June 2013
End of consultation (deadline for comments)	30 November 2013
Draft Agreed by Central Nervous System Working Party	October 2015
Adoption by CHMP for release for 2nd consultation	17 December 2015
Start of public consultation	21 December 2015
End of consultation (deadline for comments)	31 March 2016
Agreed by Central Nervous System Working Party	2 December 2016
Adopted by CHMP	15 December 2016
Date of coming into effect	1 July 2017

This guideline replaces guidelines CPMP/EWP/252/03 Rev. 1 and CPMP/EWP/612/00

Keywords	***pain, neuropathic, nociceptive, chronic, acute, analgesia, mild, moderate, guideline, medicinal products***

Guideline on the clinical development of medicinal products intended for the treatment of pain

Table of contents

5.2. Clinical Efficacy

5.2.1. Methods to assess efficacy

Pain Measurement:

There are a number of scales to assess pain but none of them is completely free of limitations.

As pain is always subjective, self-assessment scales provide the most valid measure of the experience. At present no validated objective measures are available that would be feasible in clinical trials. Pain intensity (PI) is still the key measure of efficacy of an analgesic drug and should always be reported. Among the pain rating scales the Visual analogue scale (VAS), numeric rating scale (NRS) and verbal rating scale (VRS) have been extensively used and validated[13].

The VAS is a continuous variable on a 10 cm line representing "no pain" to "worst imaginable pain", whereas the NRS is a discrete variable describing pain level with numbers from 0 to 10. Due to practical considerations the latter is the most commonly used scale. The VRS, consisting of a series of verbal pain descriptors, has been shown to lack sensitivity to detect changes in PI when compared with VAS or NRS.

The main shortcoming of the single-item pain rating scales is that they do not cover the whole range of pain qualities. Therefore multidimensional outcome measures are recommended to be used in addition, especially for trials in chronic pain. Multidimensional assessment tools have been developed to assess not only pain intensity, but also sensory and affective qualities of pain. They may reveal differential effects of treatments on different pain components. The McGill Pain Questionnaire (MPQ, SF-MPQ) is the one most frequently used in chronic pain and has been demonstrated to be a reliable and valid measurement tool. The Neuropathic Pain Scale (NPS) and Neuropathic Pain Symptom Inventory (NPSI) have been specifically developed and validated for the evaluation of neuropathic pain[15] and are recommended for the evaluation of treatment effects on neuropathic symptoms. Validated disease-specific pain measurement tools are preferred.

Measurement of physical functioning:

As chronic pain interferes with daily activities, additional patient reported outcome measures (PROs) of physical functioning are recommended[16] as secondary endpoints. They typically assess multiple aspects of function, including activities of daily living. Disease specific measures (e.g. Oswestry Disability Index for low back pain, WOMAC osteoarthritis index) have not been developed for many chronic pain conditions and the results are not applicable more broadly to other pain conditions. New disease specific measures of physical function may be considered if supportive independent validation is provided. More general Health-related quality of life (HRQOL) tools assess patient's perception of the impact of disease and treatment on daily life, physical, psychological and social functioning and well-being. The Multidimensional Pain Inventory (MPI) and the Brief Pain Inventory (BPI) both provide reliable and valid measures in diverse chronic pain conditions. The SF-36 Health Survey is the most commonly used generic measure of HRQOL and has been used in numerous clinical trials of diverse medical and psychiatric disorders. EQ-5D is also a common generic measure of HRQOL.

Measurement of emotional functioning:

Co-morbid anxiety and depression are common in patients with chronic pain. Mood changes, anxiety and sleep disturbance may change pain perception and hence may affect efficacy assessments. The pharmacodynamic effects of an investigational treatment may directly influence these comorbidities. The impact of such factors on the observed measures of pain should be evaluated where appropriate. Thus, a basal psychological and psychosocial evaluation with appropriate measures (e.g. BDI, POMS, HADS, MOS-SS) is strongly recommended for clinical trials in chronic pain.

Measurement of Global Improvement and satisfaction with treatment:

The Global Impression of Change reported by the patient (PGIC) may be a useful supportive general indicator of the overall perceived benefit of treatment in chronic pain trials[15,16].

6.1. Acute Pain

Table 1: Examples of pain models appropriate to be used in efficacy studies in acute pain

Pain Intensity		mild to moderate (in general NRS ≤ 6, VAS ≤ 60 mm)	Moderate to severe (in general NRS ≥4, VAS ≥ 40 mm)
Pain Model	Somatic pain	Tooth extraction Minor cutaneous surgery	Surgical removal of impacted 8th teeth Bunionectomy Major orthopedic surgery Major skeletal trauma Dressing changes in burns pain
	Visceral pain	Primary dysmenorrhea	Acute pancreatitis Renal / biliary colic
	Both somatic and visceral pain	Minimally invasive (laparoscopic) abdominal/gynecological surgery	Abdominal / thoracic surgery

6.2.3. Neuropathic Pain

Neuropathic pain is frequently resistant to treatment and if an effect is observed it may be transient. Non-steroidal anti-inflammatory drugs are generally ineffective. A number of medicinal products have approved indications for neuropathic pain but have variable efficacy, including anticonvulsants (gabapentinoids, carbamazepine), tricyclic antidepressants, SNRIs, topically applied lidocaine and capsaicin. The following general principles can be stated for the data requirements to support different types in indications in neuropathic pain:

- If only a single pain model is studied the approvable indication will normally be limited to the specific condition studied (e.g. trigeminal neuralgia).
- If models of just central neuropathic pain or of just peripheral neuropathic pain are studied, the indication will normally be restricted accordingly. If this is the objective of clinical development, efficacy should be shown in two or more models of central or peripheral neuropathic pain, as applicable.
- To justify a general indication for the treatment of neuropathic pain, efficacy needs to be demonstrated independently in both central and peripheral neuropathic pain. Efficacy should be shown in two or more models of peripheral neuropathic pain. Data in a single model of central neuropathic pain could be sufficient in this situation to support the broader indication.

Well established central neuropathic models include spinal cord injury and post-stroke thalamic pain. Well established peripheral neuropathic models include post herpetic neuralgia, diabetic painful

6.2.5. Efficacy studies in chronic pain

Efficacy studies in chronic pain should be performed according to the general considerations for confirmatory trials (see section 5.2.4).

Patient population

Patients included in chronic pain trials should generally have exhibited symptoms for more than 3 months with no substantial recent change in pain severity or clinical management. Clinical evaluation inclusion criteria in chronic pain trials should include the duration of pain, stability of symptoms before enrolment and pain medication history. All of these aspects should be documented for each patient. Patients' pain at baseline should be categorised according to relative contributions of nociceptive and neuropathic components, including their duration, quality and location. Screening tools may help to identify patients with a neuropathic pain component (e.g. Pain DETECT, LANSS- Pain Scale, NPQ, DN4)[15]. The location and/or distribution of underlying pathology should be characterised as far as possible. Where relevant a survey of the distribution of pain (e.g. patient pain drawing) is encouraged; a comparison with known anatomical aspects may provide valuable information on neuropathic features. Any associated negative and positive phenomena (sensory findings) should be described.

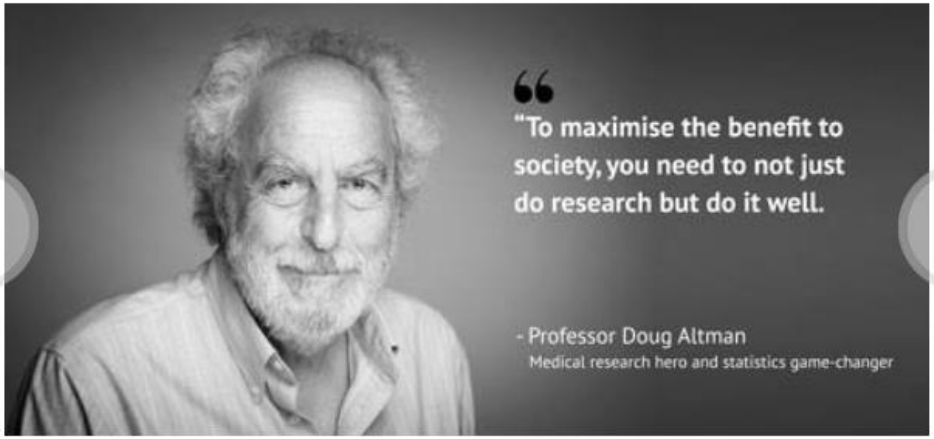
Home | Extensions | Downloads | Examples | Resources | About CONSORT



Welcome to the CONSORT Website

CONSORT stands for Consolidated Standards of Reporting Trials and encompasses various initiatives developed by the CONSORT Group to alleviate the problems arising

CONSORT 2010 Key Documents

- CONSORT 2010 Checklist
- CONSORT 2010 Flow Diagram
- CONSORT 2010 Statement
- CONSORT 2010 Explanation and Elaboration Document

http://www.consort-statement.org/

CONSORT – **CON**solidated **S**tandards **O**f **R**eporting **T**rials

1993: 30 experts comprised of medical journal editors, clinical trialists, epidemiologists, and methodologists met in Ottawa, Canada with the aim of developing a new scale to assess the quality of randomized controlled trial (RCT) reports.

1996: 1st CONSORT statement

2001: updated

2010: updated ("evolving guideline")

The CONSORT statement

The main product of CONSORT is the CONSORT Statement, which is an evidence-based, **minimum set of recommendations** for reporting randomized trials. It offers a standard way for authors to prepare reports of trial findings, facilitating their complete and transparent reporting, and aiding their critical appraisal and interpretation.

The CONSORT Statement comprises a **25-item checklist** and a **flow diagram**. The checklist items focus on reporting how the trial was designed, analyzed, and interpreted; the flow diagram displays the progress of all participants through the trial.

Declaración CONSORT 2010: actualización de la lista de comprobación para informar ensayos clínicos aleatorizados de grupos paralelos

CONSORT 2010 Declaration: Updated guideline for reporting parallel group randomised trials

Albert Cobos-Carbó [a,*] y Federico Augustovski [b]

[a] *Unidad de Bioestadística, Departamento de Salud Pública, Facultad de Medicina, Universidad de Barcelona, Barcelona, España*
[b] *Instituto de Efectividad Clínica y Sanitaria (IECS). Servicio de Medicina Familiar y Comunitaria, Hospital Italiano de Buenos Aires, Argentina*

CONSORT 2010 checklist of information to include when reporting a randomised trial*

Section/Topic	Item No	Checklist item	Reported on page No
Title and abstract			
	1a	Identification as a randomised trial in the title	1
	1b	Structured summary of trial design, methods, results, and conclusions (for specific guidance see CONSORT for abstracts)	3
Introduction			
Background and objectives	2a	Scientific background and explanation of rationale	4,5
	2b	Specific objectives or hypotheses	6
Methods			
Trial design	3a	Description of trial design (such as parallel, factorial) including allocation ratio	6
	3b	Important changes to methods after trial commencement (such as eligibility criteria), with reasons	no changes happened
Participants	4a	Eligibility criteria for participants	6
	4b	Settings and locations where the data were collected	1
Interventions	5	The interventions for each group with sufficient details to allow replication, including how and when they were actually administered	8
Outcomes	6a	Completely defined pre-specified primary and secondary outcome measures, including how and when they were assessed	9,10
	6b	Any changes to trial outcomes after the trial commenced, with reasons	no changes happened
Sample size	7a	How sample size was determined	10,11
	7b	When applicable, explanation of any interim analyses and stopping guidelines	non applicable
Randomisation:			
Sequence generation	8a	Method used to generate the random allocation sequence	7
	8b	Type of randomisation; details of any restriction (such as blocking and block size)	7
Allocation concealment mechanism	9	Mechanism used to implement the random allocation sequence (such as sequentially numbered containers), describing any steps taken to conceal the sequence until interventions were assigned	7
Implementation	10	Who generated the random allocation sequence, who enrolled participants, and who assigned participants to interventions	7
Blinding	11a	If done, who was blinded after assignment to interventions (for example, participants, care providers, those	---

		assessing outcomes) and how	
	11b	If relevant, description of the similarity of interventions	7
Statistical methods	12a	Statistical methods used to compare groups for primary and secondary outcomes	10,11
	12b	Methods for additional analyses, such as subgroup analyses and adjusted analyses	13
Results			
Participant flow (a diagram is strongly recommended)	13a	For each group, the numbers of participants who were randomly assigned, received intended treatment, and were analysed for the primary outcome	12
	13b	For each group, losses and exclusions after randomisation, together with reasons	Figure 1
Recruitment	14a	Dates defining the periods of recruitment and follow-up	12
	14b	Why the trial ended or was stopped	11
Baseline data	15	A table showing baseline demographic and clinical characteristics for each group	Table 1
Numbers analysed	16	For each group, number of participants (denominator) included in each analysis and whether the analysis was by original assigned groups	Figure 1
Outcomes and estimation	17a	For each primary and secondary outcome, results for each group, and the estimated effect size and its precision (such as 95% confidence interval)	Figure 3, table 2 and 3
	17b	For binary outcomes, presentation of both absolute and relative effect sizes is recommended	13
Ancillary analyses	18	Results of any other analyses performed, including subgroup analyses and adjusted analyses, distinguishing pre-specified from exploratory	13
Harms	19	All important harms or unintended effects in each group (for specific guidance see CONSORT for harms)	13,14
Discussion			
Limitations	20	Trial limitations, addressing sources of potential bias, imprecision, and, if relevant, multiplicity of analyses	16
Generalisability	21	Generalisability (external validity, applicability) of the trial findings	15,16
Interpretation	22	Interpretation consistent with results, balancing benefits and harms, and considering other relevant evidence	16,17
Other information			
Registration	23	Registration number and name of trial registry	3,6
Protocol	24	Where the full trial protocol can be accessed, if available	6
Funding	25	Sources of funding and other support (such as supply of drugs), role of funders	2,18

*We strongly recommend reading this statement in conjunction with the CONSORT 2010 Explanation and Elaboration for important clarifications on all the items. If relevant, we also recommend reading CONSORT extensions for cluster randomised trials, non-inferiority and equivalence trials, non-pharmacological treatments, herbal interventions, and pragmatic trials. Additional extensions are forthcoming: for those and for up to date references relevant to this checklist, see www.consort-statement.org.

Métodos: sección 3 - 12

Randomized patients (in a 1:1 ratio) received the combination-therapy of 10 mg of daptomycin intravenously per kilogram of body weight daily plus 2 g of fosfomycin intravenously each 6 hours (experimental group) or the mono-therapy of 10 mg of daptomycin intravenously per kilogram of body weight daily (control group).

Daptomycin was administered intravenously a 30-minute infusion once a day, and fosfomycin was administered intravenously a 60-minute infusion each 6 hours. The duration of therapy was determined by the investigator on the basis of the working diagnosis. If the bacteremia was not complicated, the treatment duration was of the 10-14 days; if the bacteremia was complicated the treatment duration was of the 28-42 days.

CONSORT 2010. Otra información: sección 23 - 25

Otra información		
Registro	23	Número de registro y nombre del registro de ensayos
Protocolo	24	Dónde puede accederse al protocolo completo del ensayo, si está disponible
Financiación	25	Fuentes de financiación y otras ayudas (como suministro de medicamentos), papel de los financiadores

CONSORT 2010 checklist of information to include when reporting a randomised trial*

Section/Topic	Item No	Checklist item	Reported on page No
Title and abstract			
	1a	Identification as a randomised trial in the title	1
	1b	Structured summary of trial design, methods, results, and conclusions (for specific guidance see CONSORT for abstracts)	3
Introduction			
Background and objectives	2a	Scientific background and explanation of rationale	4,5
	2b	Specific objectives or hypotheses	6
Methods			
Trial design	3a	Description of trial design (such as parallel, factorial) including allocation ratio	6
	3b	Important changes to methods after trial commencement (such as eligibility criteria), with reasons	no changes happened
Participants	4a	Eligibility criteria for participants	6
	4b	Settings and locations where the data were collected	1
Interventions	5	The interventions for each group with sufficient details to allow replication, including how and when they were actually administered	8
Outcomes	6a	Completely defined pre-specified primary and secondary outcome measures, including how and when they were assessed	9,10
	6b	Any changes to trial outcomes after the trial commenced, with reasons	no changes happened
Sample size	7a	How sample size was determined	10,11
	7b	When applicable, explanation of any interim analyses and stopping guidelines	non applicable
Randomisation:			
Sequence generation	8a	Method used to generate the random allocation sequence	7
	8b	Type of randomisation; details of any restriction (such as blocking and block size)	7
Allocation concealment mechanism	9	Mechanism used to implement the random allocation sequence (such as sequentially numbered containers), describing any steps taken to conceal the sequence until interventions were assigned	7
Implementation	10	Who generated the random allocation sequence, who enrolled participants, and who assigned participants to interventions	7
Blinding	11a	If done, who was blinded after assignment to interventions (for example, participants, care providers, those	---

		assessing outcomes) and how	
	11b	If relevant, description of the similarity of interventions	7
Statistical methods	12a	Statistical methods used to compare groups for primary and secondary outcomes	10,11
	12b	Methods for additional analyses, such as subgroup analyses and adjusted analyses	13
Results			
Participant flow (a diagram is strongly recommended)	13a	For each group, the numbers of participants who were randomly assigned, received intended treatment, and were analysed for the primary outcome	12
	13b	For each group, losses and exclusions after randomisation, together with reasons	Figure 1
Recruitment	14a	Dates defining the periods of recruitment and follow-up	12
	14b	Why the trial ended or was stopped	11
Baseline data	15	A table showing baseline demographic and clinical characteristics for each group	Table 1
Numbers analysed	16	For each group, number of participants (denominator) included in each analysis and whether the analysis was by original assigned groups	Figure 1
Outcomes and estimation	17a	For each primary and secondary outcome, results for each group, and the estimated effect size and its precision (such as 95% confidence interval)	Figure 3, table 2 and 3
	17b	For binary outcomes, presentation of both absolute and relative effect sizes is recommended	13
Ancillary analyses	18	Results of any other analyses performed, including subgroup analyses and adjusted analyses, distinguishing pre-specified from exploratory	13
Harms	19	All important harms or unintended effects in each group (for specific guidance see CONSORT for harms)	13,14
Discussion			
Limitations	20	Trial limitations, addressing sources of potential bias, imprecision, and, if relevant, multiplicity of analyses	16
Generalisability	21	Generalisability (external validity, applicability) of the trial findings	15,16
Interpretation	22	Interpretation consistent with results, balancing benefits and harms, and considering other relevant evidence	16,17
Other information			
Registration	23	Registration number and name of trial registry	3,6
Protocol	24	Where the full trial protocol can be accessed, if available	6
Funding	25	Sources of funding and other support (such as supply of drugs), role of funders	2,18

*We strongly recommend reading this statement in conjunction with the CONSORT 2010 Explanation and Elaboration for important clarifications on all the items. If relevant, we also recommend reading CONSORT extensions for cluster randomised trials, non-inferiority and equivalence trials, non-pharmacological treatments, herbal interventions, and pragmatic trials. Additional extensions are forthcoming: for those and for up to date references relevant to this checklist, see www.consort-statement.org.

Una bona investigació
pot no conduir a un bon article
si no es coneix la manera adequada de redactar-ho

Un article mal redactat
pot fer malbé el resultat (l'evidència)

Defining the Role of Authors and Contributors

PAGE CONTENTS

Defining the Role of Authors and Contributors

1. Why Authorship Matters

Authorship confers credit and has important academic, social, and financial implications. Authorship also implies responsibility and accountability for published work. The following recommendations are intended to ensure that contributors who have made substantive intellectual contributions to a paper are given credit as authors, but also that contributors credited as authors understand their role in taking responsibility and being accountable for what is published.

Because authorship does not communicate what contributions qualified an individual to be an author, some journals now request and publish information about the contributions of each person named as having participated in a submitted study, at least for original research. Editors are strongly encouraged to develop and implement a contributorship policy. Such policies remove much of the ambiguity surrounding contributions, but leave unresolved the question of the quantity and quality of contribution that qualify an individual for authorship. The ICMJE has thus developed criteria for authorship that can be used by all journals, including those that distinguish authors from other contributors.

Defining the Role of Authors and Contributors

2. Who Is an Author?

The ICMJE recommends that authorship be based on the following 4 criteria:

- Substantial contributions to the conception or design of the work; or the acquisition, analysis, or interpretation of data for the work; AND
- Drafting the work or revising it critically for important intellectual content; AND
- Final approval of the version to be published; AND
- Agreement to be accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved.

Defining the Role of Authors and Contributors

3. Non-Author Contributors

Contributors who meet fewer than all 4 of the above criteria for authorship should not be listed as authors, but they should be acknowledged. Examples of activities that alone (without other contributions) do not qualify a contributor for authorship are acquisition of funding; general supervision of a research group or general administrative support; and writing assistance, technical editing, language editing, and proofreading. Those whose contributions do not justify authorship may be acknowledged individually or together as a group under a single heading (e.g. "Clinical Investigators" or "Participating Investigators"), and their contributions should be specified (e.g., "served as scientific advisors," "critically reviewed the study proposal," "collected data," "provided and cared for study patients", "participated in writing or technical editing of the manuscript").

Because acknowledgment may imply endorsement by acknowledged individuals of a study's data and conclusions, editors are advised to require that the corresponding author obtain written permission to be acknowledged from all acknowledged individuals.
