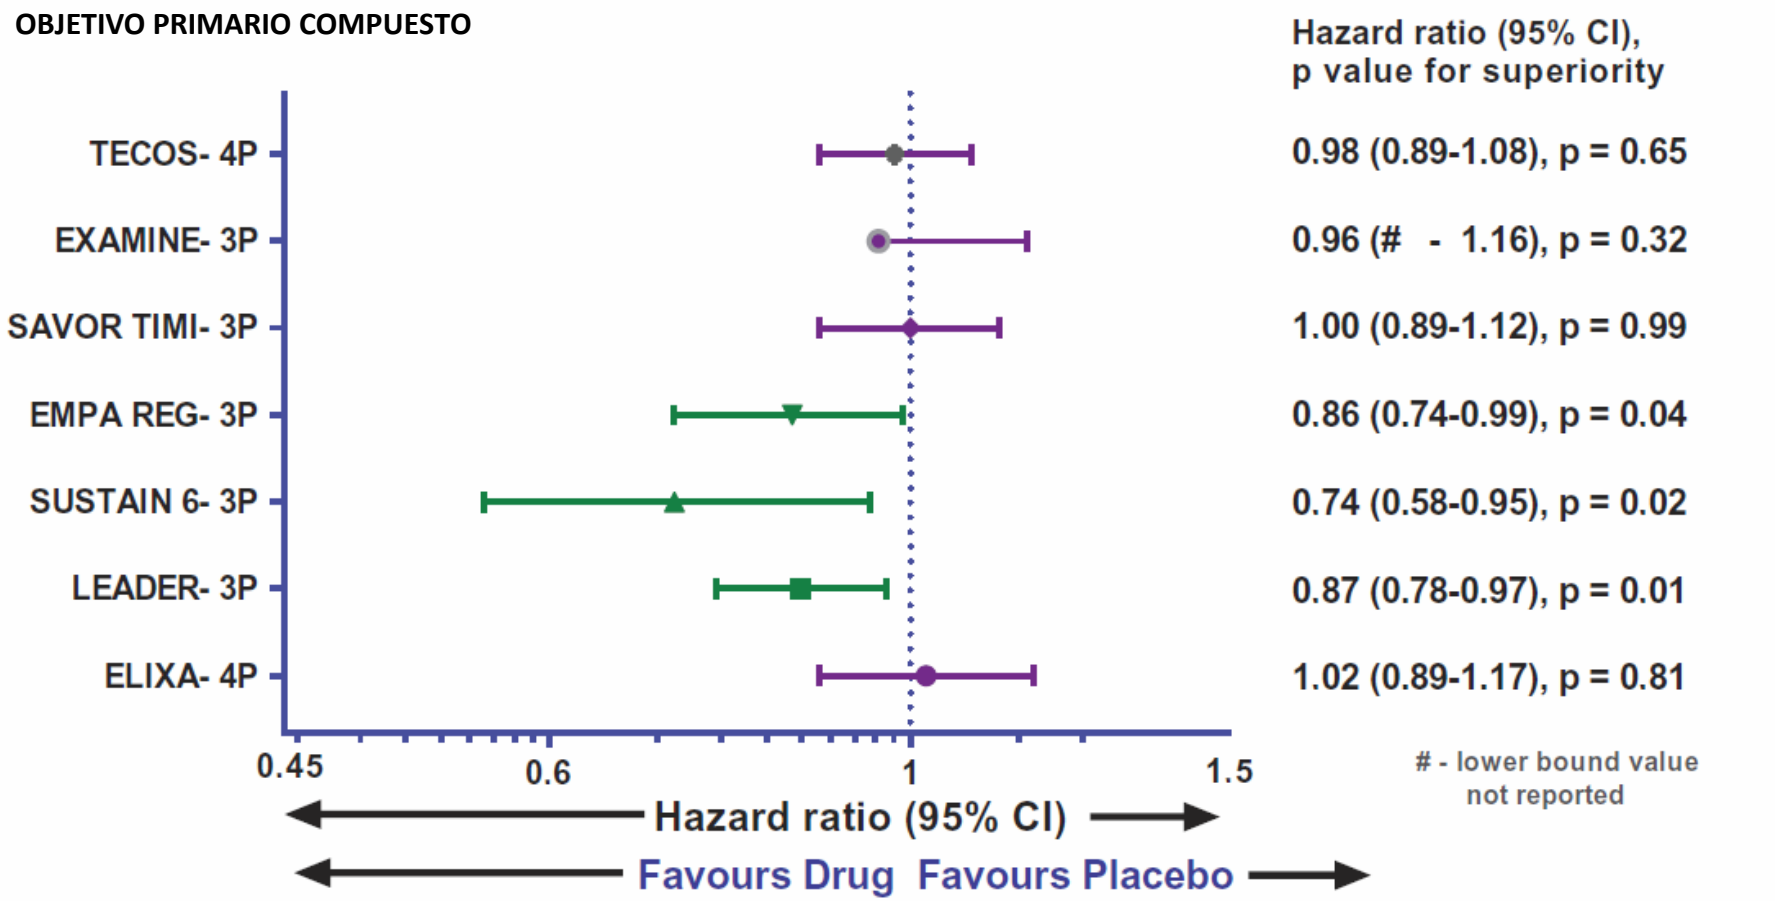
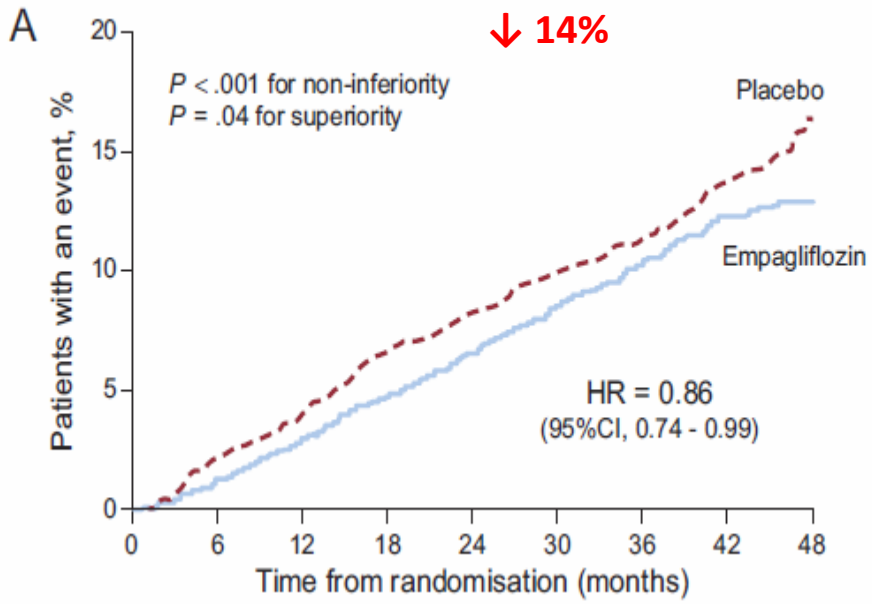
Ensayos de seguridad CV en DM2



Sing AK. Expert Rev Clin Pharmacol. 2017;6:1-14

ESTUDIO EMPA-REG



- 7020 pacientes con DM2 + ECV
- Mediana de seguimiento: 3,1a
- OP compuesto: muerte por ECV, IAM no fatal, ictus no fatal

↓ 38% MORTALIDAD CV

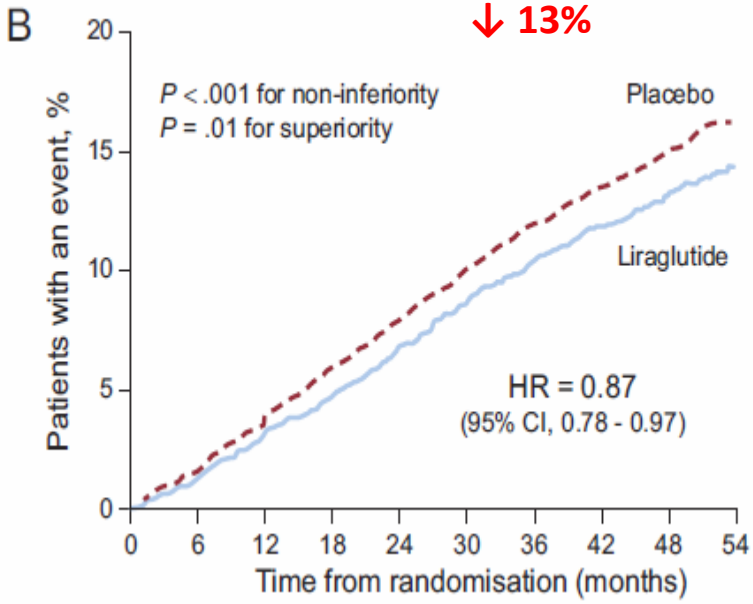
↓ 32% MORTALIDAD POR CUALQUIER CAUSA

↓ 35% HOSPITALIZACIÓN POR IC

∅ IAM no fatal, ictus no fatal

Zinman B. NEJM. 2015;373:2117-28

ESTUDIO LEADER



- 9342 pacientes con DM2: ECV (≥50a) o ≥ 1 FRCV (≥60a)
- Mediana de seguimiento: 3,8a
- OP compuesto: muerte por ECV, IAM no fatal, ictus no fatal

↓ 22% MORTALIDAD CV

↓ 15% MORTALIDAD POR CUALQUIER CAUSA

∅ HOSPITALIZACIÓN POR IC

∅ IAM no fatal, ictus no fatal

Marso S. NEJM. 2016;375:311-22

Start with Monotherapy unless:

A1C is greater than or equal to 9%, **consider Dual Therapy.**

A1C is greater than or equal to 10%, blood glucose is greater than or equal to 300 mg/dL, or patient is markedly symptomatic, **consider Combination Injectable Therapy** (See Figure 8.2).

Monotherapy — Metformin — Lifestyle Management

EFFICACY*	high
HYPO RISK	low risk
WEIGHT	neutral/loss
SIDE EFFECTS	GI/lactic acidosis
COSTS*	low

If A1C target not achieved after approximately 3 months of monotherapy, proceed to 2-drug combination (order not meant to denote any specific preference — choice dependent on a variety of patient- & disease-specific factors):

Dual Therapy — Metformin + — Lifestyle Management

	Sulfonylurea	Thiazolidinedione	DPP-4 inhibitor	SGLT2 inhibitor	GLP-1 receptor agonist	Insulin (basal)
EFFICACY*	high	high	intermediate	intermediate	high	highest
HYPO RISK	moderate risk	low risk	low risk	low risk	low risk	high risk
WEIGHT	gain	gain	neutral	loss	loss	gain
SIDE EFFECTS	hypoglycemia	edema, HF, fxs	rare	GU, dehydration, fxs	GI	hypoglycemia
COSTS*	low	low	high	high	high	high

If A1C target not achieved after approximately 3 months of dual therapy, proceed to 3-drug combination (order not meant to denote any specific preference — choice dependent on a variety of patient- & disease-specific factors):

Triple Therapy — Metformin + — Lifestyle Management

Sulfonylurea +	Thiazolidinedione +	DPP-4 inhibitor +	SGLT2 inhibitor +	GLP-1 receptor agonist +	Insulin (basal) +
TZD	SU	SU	SU	SU	TZD
or DPP-4-i	or DPP-4-i	or TZD	or TZD	or TZD	or DPP-4-i
or SGLT2-i	or SGLT2-i	or SGLT2-i	or DPP-4-i	or SGLT2-i	or SGLT2-i
or GLP-1-RA	or GLP-1-RA	or Insulin[§]	or GLP-1-RA	or Insulin[§]	or GLP-1-RA
or Insulin[§]	or Insulin[§]		or Insulin[§]		

If A1C target not achieved after approximately 3 months of triple therapy and patient (1) on oral combination, move to basal insulin or GLP-1 RA, (2) on GLP-1 RA, add basal insulin, or (3) on optimally titrated basal insulin, add GLP-1 RA or mealtime insulin. Metformin therapy should be maintained, while other oral agents may be discontinued on an individual basis to avoid unnecessarily complex or costly regimens (i.e., adding a fourth antihyperglycemic agent).

Combination Injectable Therapy (See Figure 8.2)

American Diabetes Association®

In patients with long-standing suboptimally controlled type 2 diabetes and established atherosclerotic cardiovascular disease, empagliflozin or liraglutide should be considered as they have been shown to reduce cardiovascular and all-cause mortality when added to standard care. Ongoing studies are investigating the cardiovascular benefits of other agents in these drug classes. B

Objetivos del tratamiento de la diabetes

Objetivos primarios

- **Evitar complicaciones**
- Mejorar la calidad de vida
- Reducir mortalidad
- Evitar los síntomas de la hiperglucemia

Objetivos intermedios

- Mejorar el control glucémico
- Mejorar el control de los factores de RCV:
  Presión arterial, Lípidos, Tabaco,
  Obesidad/Obesidad abdominal

Type 2 diabetes significantly increases the risk of cardiovascular disease

Overall, people with diabetes are 2-4 times more likely to develop cardiovascular disease than those without diabetes[1]

	Increased risk (x-fold)
Stroke[2,3]	2-4
Transient ischemic attack[1]	2-6
Coronary heart disease[3]	2
Coronary death[3,4]	2-3
Non-fatal myocardial infarction[3]	2
Heart failure[1]	2-3
Peripheral vascular disease[1]	
Lower-limb amputation	15-40
Intermittent claudication	3-9

Type 2 diabetes and incidence of cardiovascular diseases: a cohort study in 1·9 million people

Anoop Dinesh Shah, Claudia Langenberg, Eleni Rapsomaniki, Spiros Denaxas, Mar Pujades-Rodriguez, Chris P Gale, John Deanfield, Liam Smeeth, Adam Timmis, Harry Hemingway

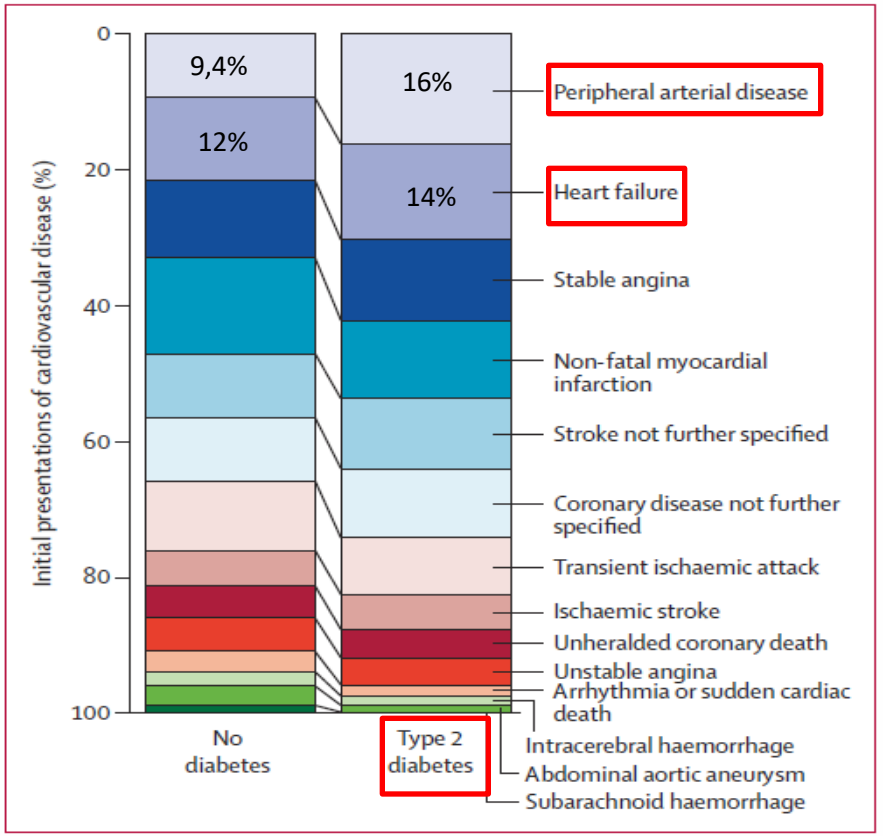

***Figure 1*: Distribution of initial presentations of cardiovascular diseases**
Distribution of initial presentations of cardiovascular disease in participants with and without type 2 diabetes and no history of cardiovascular disease.

Interpretation Heart failure and peripheral arterial disease are the most common initial manifestations of cardiovascular disease in type 2 diabetes. The differences between relative risks of different cardiovascular diseases in patients with type 2 diabetes have implications for clinical risk assessment and trial design.

Shah AD. Lancet Diabetes Endocrinol. 2015;3:105-113

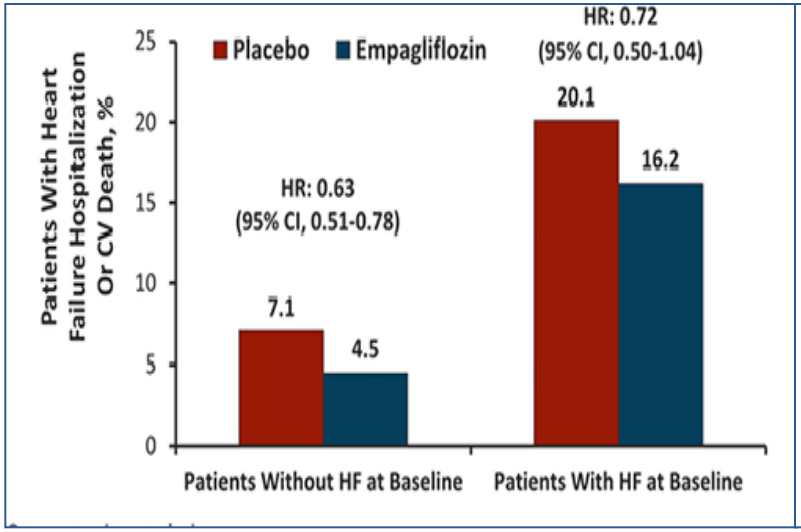
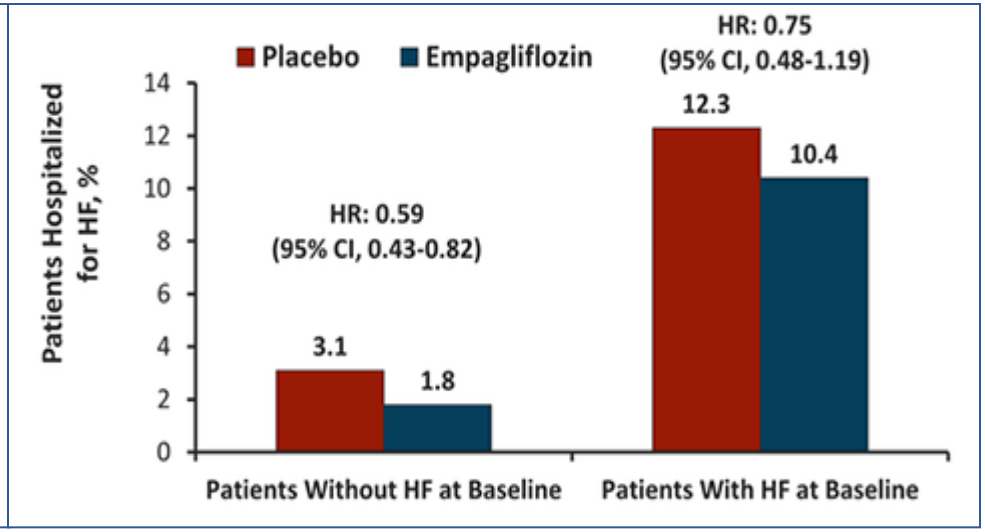
All-cause hospitalization	925 (39.6)	183.3	1725 (36.8)	161.9	0.89 (0.82–0.96)	0.003

CI, confidence interval; HR, hazard ratio; MedDRA, Medical Dictionary for Regulatory Activities.
[a]Based on narrow standardized MedDRA query 'cardiac failure', which comprised these preferred terms: acute pulmonary oedema; cardiac failure; cardiac failure, acute; cardiac failure, chronic; cardiac failure, congestive; cardiogenic shock; cardiopulmonary failure; left ventricular failure; pulmonary oedema; right ventricular failure.
[b]Adverse events reported as serious adverse events by investigator. Patients treated with at least one dose of study drug.





Fitchett D. Eur Heart J. 2016;37:1526-34

Comparison of Long-Term Mortality for Cardiac Diseases in Patients With Versus Without Diabetes Mellitus

El 75% de la mortalidad a largo plazo de los diabéticos es de causa CV

- 1293 pacientes ingresados

(32% DM)

- Evaluar mortalidad CV y por todas las causas (Media de seguimiento de 58 m)

- ✓ La causa más frecuente de ingreso hospitalario fue el SCA, seguido de la IC.
- ✓ Mortalidad hospitalaria > en diabéticos (5,6% vs 1,7%; p< 0,01).
